Instructor: Professor A. Yethiraj, 8305B Chemistry, 608 262 0258, Office hours: By appointment

Canvas Course URL https://canvas.wisc.edu/courses/76310

Instructional mode: face-to-face

Course Description: Fundamentals of statistical mechanics; applications to equilibrium and non-equilibrium properties of gases and condensed phases; selected advanced topics.

Requisite: Graduate or professional standing

How Credit Hours are Met: This class meets for thirty 50-minute lectures over the course of the semester. Students enrolled for two credits are expected to do at least 90 hours of learning activities, which includes class attendance, reading, studying, preparation, problem sets, and other learning activities. Students enrolled for three credits will have an additional 45 hours of outside class work and meetings with the instructor related to their term project.

Grading: One mid-term exam (100 points), 5 problem sets (10 points each), and one final exam (200 points). Course graded on a curve with an AB average.

Learning outcomes: Students are expected to be able to read the literature in statistical mechanics, develop models for common experimental systems, and perform mean-field calculations for these models. In addition, students will learn fundamental aspects of the following topics:

- Classical equilibrium statistical mechanics: Review of distribution functions, structure of liquids, x-ray and neutron scattering, computer simulation methods.

- Dynamics of classical systems: Random walks, Brownian motion, Langevin and generalized Langevin equations, rate processes in condensed matter.
